Claim 1; Page 14; 225pp; English.

an ligase). The polymucleotides of the invention are used to detect
ligase). The polymucleotides of the invention are used to detect
Staphylococcus nucleic acids in a biological sample from an animal for
diagnosing Staphylococcus infections. The polypeptides of the invention
are used to detect anti-Staphylococcus antibodies in a biological sample
from an animal to diagnose Staphylococcus infections. The polypeptides
are also used in vaccines to elicit protective antibodies in an animal to
a member of the Staphylococcus genus and for preventing or attenuating an
infection caused by a member of the Staphylococcus genus e.g wound
infection, cellulitis, burn infection, eyelid infection, food possoning,
joint infection, neonatal conjunctivitis, osteomyelitis, skin infection,
scalded skin syndrome (also known as toxic epidermal necrosis, Ritter's The sequence encodes S. aureus MurC (UDP-N-acetylmuramate:L-alanine

                                                                                                                                                                                                                     ö
disease and Lyell's disease), toxic shock syndrome and endocarditis. The polynucleotides may also be used in vaccines and for preventing or attenuating a Staphylococcus infection. Antibodies to the polypeptides may be used to purify, detect and target the polypeptides in vivo diagnostic and therapeutic methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     360

Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria. WPI; 2003-468119/44. P-PSDB; ADD15463

Claim 20; SEQ ID NO 27; 325pp; English

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), CS Exreptococcus pneumoniae (S. pneumoniae) and Escherichia coli (B. coli) that provide novel antimicrobial targets. Specifically, it refers to colypeptides that are involved in membrane biosyntheeis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also characterisation by labelling with isotopic or heavy atoms, and also information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for developing antimicrobial agents for use as surface disinfectants, food products to eliminate potential pathogens. This polynucleotide sequence is DNA predicted from the genomic sequence of S. aureus UDP-N-acetylmuramate-alanine ligase (murc) of the invention.

                                                                                                                                                            The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an autibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of

2003-468119/44 WPI; 2003-468119, P-PSDB; ADD15465 Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

SEQ ID NO 29; 325pp; English. Claim 20;

This interior teraces to me structural and interioral characterisation.

Streptococcus pneumoniae (S. pneumoniae) and Escherichia coli (E. coli)

Streptococcus pneumoniae (S. pneumoniae) and Escherichia coli (E. coli)

Chat provide novel antimicrobial targetes. Specifically, it refers to polypeptides that are involved in membrane biosynthesis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also fusion proteins. These proteins provide structural and functional confusation to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for developing antimicrobial agents for use as surface disinfectents,

Consideration of the experimentally predicted DNA of S. aureus UDP-Ninvention relates to the structural and functional characterisation acetylmuramate-alanine ligase (murc) of

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 7596; 1766pp; English.

the inventor tradece to an isolated nucleic acta comprising any one or the inventor tradece by an interest specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid confidence operably linked to the nucleic acid confidence operably linked to the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated conflowed and propertied for interest and isolated confidence or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an influence of the activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound collection of strains; or (13) identifying the target of a compound that inhibits collection of strains; or (13) identifying the target of a compound that inhibits or sereening for homologous nucleic acids are useful for collectional and all and all and all and antisence moleic acids are useful or an organism. The antisence moleic acids are useful for collection of an organism. The antisence moleic acids are useful for collections or screening for nondivernal acids are useful. drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at one of invention relates to an isolated nucleic acid comprising ftp.wipo.int/pub/published_pct_sequences

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia soli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonae aeruginosa and Entercoccus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can antibodies care compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids. Claim 27; SEQ ID NO 8195; 511pp; English

οĘ

Claim 27; SEQ ID NO 4242; 511pp; English.

antibiotics, comprise sequences of antisense nucleic acids

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes,

their use in the discovery of novel antibiotics, the essential genes
themselves and the encoded proteins. The prokaryotes used are Escherichia
coli, Staphylococcus aureus, Salmonella typhi, Rlebsiella pneumoniae,
Pseudomonas aeruginosa and Esterococcus faccalis. The invention is also
useful for the identification of potential new targets for antibiotic
development. The antisense nucleic acids can also be used to identify
proteins used in proliferation, to express these proteins, and to obtain
antibodies capable of binding to the expressed proteins. The proteins can
be used to screen compounds in rational drug discovery programmes. The
antisense nucleic acids equence is also useful to screen for homologous
nucleic acids which are required for cell proliferation in a wide variety
of organisms. The present sequence encodes an essential prokaryotic
cellular proliferation protein. Note: The sequence data for this patent
did not form part of the printed specification, but was obtained in
electronic format directly from WIDO at

The present sequence represents a MurC gene encoding a Staphylococcus aureus UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide). Host cell contraining an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibitory nucleic acid or competitive polypeptide are useful for inhibitory nucleic acid or competitive polypeptide are useful for inhibitory nucleic acid or competitive polypeptide are useful for inhibitory nucleic acid or competitive polypeptide are useful for confection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising cutibodies, to identify modularors or specific receptors; in rational days or influence and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; in influence or influence and for genetic influences and influences and influences are influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences and influences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

GATCAATTAGAGAAAATACTGGCGCATTAACGATACAAGATTTAATTGATAAATTGAAG

1741

WPI; 1997-374922/35

:leotide(s) and proteins derived from Staphylococcus aureus -on computer readable medium and used in the production of anti-Polymucleotide(s) and .aureus vaccines.

Claim 1; Page 1287-1288; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows buttaive functions to be assigned so industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can lake be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used the meanly meanly are useful as primers or probes for isolating head-allow meanly. readable

The invention relates to a UDD-N-acetylmuramate:L-alanine ligase (Murc polypeptide) encoded by the S. aureus Murc gene. Host cells containing an expression system comprising the Murc gene can be used for the ceptression system comparising the Murc gene can be used for the creombinant production of the polypeptide. Agonists or the Murc polypeptide are used to treat conditions requiring increased activity or competitive polypeptide are useful for inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide acid or competitive polypeptide are useful for inhibiting the polypeptide acid or bacterial (especially S. aureus) infections. They are also useful against the intibacterial agants are useful to treat in-dwelling devices for The antibacterial agants are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for of bacteria to matrix proteins. The Murc polypeptide is also useful for antibodies; to identify modulators or specific receptors; in rational cuseful in antisense/ribozyme therapeutics; to detect mutant Murc gene; for chromosomal mapping; to determine bacterial serotype; and for genetic 1801 GIGCATCGTTAATTAATGAAGATTCTATTAATGTATTAGAACAATTTGATAATGCTGTTA 1860 1861 ITTTATTTATGGGGGGGGGATGATTCAAAATTACAAAATGCATATTTAGATAAATTAG 1920 New isolated MurC polypeptide from Staphylococcus aureus and related nucleic acid - useful in diagnosis, treatment and prevention of bacterial GTGCATCGTTAATTAATGAAGATTCTATTAATGTATTAGAACAATTTGATAATGCTGTTA TTTTATTTATGGGTGCAGGTGATATTCAAAATTACAAAATGCATATTTAGATAAATTAG Partial nucleotide sequence of the Murc gene. ```
function, and represents a DRA Sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WGHU29 (NGIMB 40711). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, particulated, central nervous, eye, kindey, uninary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Entercoccus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of creaming.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of organisms. The present sequence is an antisense oligonuclectide of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ACCATTTGATGCTAATAACATAAAGAAGATATGGTAGTTATACAAGGTAATGCATTCGC 198

Claim 1; SEQ ID NO 5503; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a pronoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular or proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway contained for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an identifying agence for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the strains is present in a culture or collection of a trains; or (13) identifying the target of a compound that inhibits the extent of a trains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleid are useful for a proliferation of an organism. The antisense nucleid are useful for proliferation of an organism. The antisense nucleid are useful for proliferation of an organism. The antisense nucleid are useful for proliferation of an organism. proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the 6213 antisense sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the property from Fig. Wipo.int/pub/published pct_sequences. (Updated on 27-OCT-2003 to standardise OS field)

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins The prokaryotes used are Escherichia Feudemonas acruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The programmes. The antisense nucleic acid sequence is also useful to screen for homologous 332 GAGTAGCCATGAAGAATAGTACGTGCACATCAATTGAAATTAGATGTTGTAAGTTTATAA 138 TAAAACTICTACAACAGGTITATIATCACAIGTTAIGAAIGGIGATAAAAAGACTICAIT 392 TAAAACTICTACAACAGGTTTATTATCACATGTTATGAATGGTGATAAAAAGACTTCATT 18 TGATITITIAGGACAGATTATTGATCAATATACTTCAGTAGCTGTAACTGGTGCACATGG 78 TGATTTTTAGGACAGATTATTGATCAATATACTTCAGTAGCTGTAACTGGTGCACATGG Staphylococcus aureus cellular proliferation inhibitory sequence #246. themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonalla typhi, Klebsiella pneumoniae, Pseudomonae aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is an antisense oligonucleotide of the invention. Note: The sequence data for this patent did not form part of from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              418

Claim 1; Page 14; 225pp; English.

The sequence encodes S. aureus MurC (UDP-N-acetylmuramate:L-alanine ligase). The polynucleotides of the invention are used to detect

Mon

Staphylococcus nucleic acids in a biological sample from an animal for diagnosing Staphylococcus infections. The polypeptides of the invention are used to detect anti-Staphylococcus infections. The polypeptides from an animal to diagnose Staphylococcus infections. The polypeptides are also used in vaccines to elicit protective antibodies in an animal to a member of the Staphylococcus genus and for preventing or attenuating an infection caused by a member of the Staphylococcus genus e.g wound infection caused by a member of the Staphylococcus genus e.g wound infection, cellulitis, burn infection, eyelid infection, food poisoning, confection, and infection, neonatal conjunctivitis, osteomyelitis, skin infection, scalded skin syndrome (also known as toxic epidermal necrosis, Ritter's disease and Lyell's disease), toxic shock syndrome and endocarditis. The polymolocides may also be used in vaccines and for preventing or attenuating a Staphylococcus infection. Antibodies to the polypeptides may be used to purify, detect and target the polypeptides in in vitro and in vivo diagnostic and therapeutic methods

Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

Vedadi M, Alam MZ, Awrey D, Beattie B; Kanagarajah D, Nethery K, Ng I, Mansoury K; Viola C, Wrezel O;

Claim 20; SEQ ID NO 27; 325pp; English.

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus preumoniae (S. pneumoniae) and Sacherichia coli (E. coli) that provide novel antimicrobial targets. Specifically, it refers to critical role in the life cycle and viability of their pathogenic species of critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also fusion proteins. These proteins provide structural and functional information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for develophing antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating for sequence is DNA predicted from the genomic sequence of S. aureus UDP-Nacetylmuramate-alanine ligase (murc) of the invention,

colorigin. These modified version of these proteins to treat

colorigin proteins. These proteins provide structural and functional

colorigin proteins provide structural and functional

colorigin associated with a particular pathogenic species. As such, they

colorigin antimicrobial agents for use as surface disinfectants,

colorigin antimicrobial agents for use as surface disinfectants,

colorigin antimicrobial and as food preservatives or in treating

colorigin products to eliminate potential pathogens. This polynucleotide

colorigin the experimentally predicted DNA of S. aureus UDP-N-

colorigin and annine ligase (murc) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepais in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of

antisense nucleic acids, useful for identifying proteins or screening homologous nucleic acids required for cellular proliferation to atte candidate molecules for rational drug discovery programs.

the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid enoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits escilular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the inhibits in which the gene product is overexpressed or underexpressed; (12) determining the extent of the inhibits in which the gene or inhich and in the properties of the compound the inhibits in which the gene or inhich a proliferation or inderexpenses of the compound the inhibits in which the gene or inhich and in the properties of the compound the inhibits in which the gene or inhich and in the properties of the compound the inhibits in the extent the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the compound the to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antiseense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids The invention relates to an isolated nucleic acid comprising any one

their use in the discovery of novel antibiotics, the essential genes
themselves and the encoded proteins. The prokaryotes used are Escherichia
coli, Staphylococcus aureus, Salmonella typhi, Rlebsiella pneumoniae,
Pseudomonas aeruginosa and Esterococcus faceziis. The invention is also
useful for the identification of potential new targets for antibiotic
development. The antisense mucleic acids can also be used to identify
proteins used in proliferation, to express these proteins, and to obtain
antibodies capable of binding to the expressed proteins. The proteins can
catisense nucleic acids sequence is also useful to screen for nomologous
nucleic acids which are required for cell proliferation in a wide variety
of organisms. The present sequence encodes an essential prokaryotic
collular proliferation protein. Note: The sequence data for this patent
did not form part of the printed apecification, but was obtained in
electronic format directly from WIPO at

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Seudomonas aeruginosa and Enterococcus faccalls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The proteins can be used to screen compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in clectronic format directly from WIPO at the variety fits. wipo.int/pub/published_pot_sequences

The present sequence represents a MurC gene encoding a Staphylococcus arreaus UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide). Host cell containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (sepecially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising artibodies; to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The MurC gene sequences are useful in antisense/riboxyme therapeutics; to detect mutant MurC gene; for chromosomal mapping; to determine bacterial serotype; and for genetic New isolated MurC polypeptide from Staphylococcus aureus and related nucleic acid - useful in diagnosis, treatment and prevention of bacterial GTTGCTCTTAGAAATAAGGGGATAAAAATATTACCATTTGATGCTAATAACATAAAAGAA 142 GTTGCTCTTAGAAATAAGGGGATAAAATATTACCATTTGGTGCTAATAACATAAAAA CATCAATTGAAATTAGATGTTGTAAGTTATAATGATTTTTTAGGACAGATTATTGATCAA 1 ATGACACACTATCATTTTGTCGGAATTAAAGGTTCTGGCATGAGTTCATTAGCACAAATC 22 ATGACACTATCATTTTGTCGGAATTAAAGGTTCTGGCATGAGTTCATTAGCACAAATC 61 ATGCATGATTTAGGACATGAAGTTCAAGGATCGGATATTGAGAACTACGTATTTACAGAA 82 AIGCAIGAITIAGGACAIGAAGIICAAGGAICGGAIAIIGAGAACIACGIAITIACAGAA GATATGGTAGTTATACAAGGTAATGCATTCGCGAGTAGCCATGAAGAAATAGTACGTGCA GATATGGTAGTTATACAAGGTAATGCATTCGCGAGTAGCCATGAAGAAATAGTACGTGCA Gaps DB 2; Length 1351; ; Sequence 1351 BP; 471 A; 166 C; 260 G; 454 T; 0 U; 0 Other; 98.1%; Score 1293.2; DB 2; Length larity 99.0%; Pred. This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The colypeptides can also be used in a kit for the immunodetection of solypeptides can also be used in a kit for the immunodetection of skin and surgical wound infections, scalded skin syndrome, toxic shock of syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can the computer condition and their fragments are useful as primers or probes for isolating the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the computer and the c

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

the inventor trainers of the control of a call. Also included are of the mucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a proliferation of a call. Also included are:

(1) a vector comprising a proliferation of a call. Also included are:

(1) a vector comprising a proliferation of a call. Also included are:

(2) a host call containing the vector; (3) an isolated prolypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding callisense nucleic acid; (4) an antibody capable of specifically binding callisense nucleic acid; (4) an antibody capable of specifically binding callisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for collidar proliferation or the biological pathway required for proliferation, or that inhibits proliferation or the biological pathway required for proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent compound's activity; (11) a culture compound that inhibits the compound of an organism. The antisense nucleic acids are useful for confidentifying proteins or screening for homologous nucleic acids required confidentifying the careful confidentifying the capacidate molecules for rational confidentifying the capacidate molecules for rational confidentifying the capacidate molecules for rational confidentifying the capacidate molecules for rational confidentifying the capacidate and confidentifying the capacidate candidate molecules for rational confidentifying the capacidate candidate molecules for rationa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. preumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            screening

The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MurC polypeptide from Staphylococcus aureus and related - useful in diagnosis, treatment and prevention of bacterial
